INTRODUCTION

The black bear harvest report presents black bear harvest and hunter effort trends across the state of Utah, based on data collected from bear hunters and compiled by the Utah Division of Wildlife Resources (Division). This report represents the black bear portion of Federal Aid Project W-65-M, segments 60 and 61, grant agreement periods October 1, 2011 through September 30, 2012 and October 1, 2012 through September 30, 2013, respectively. This Federal Aid project covers the 2012 hunting season. This report presents black bear statewide trends since the 1960s, as well as population trend indicators.

In addition to its traditional limited-entry hunts, beginning in 2012 Utah offered two new types of bear hunts: spot-and-stalk only hunts, where hunters could not use dogs or bait; and harvest-objective hunts, where an unlimited number of hunters could hunt in the harvest-objective unit until the quota was met or the season ended. Dogs or bait were not allowed in bear harvest-objective units, except for the spring Wasatch Mtns, Avintaquin/Currant Creek unit where dogs were allowed. Black bear pursuit was open in all 23 bear units. Three units (Book Cliffs, La Sal, and San Juan) were closed to general black bear pursuit during the summer and only pursuers who applied for and obtained a restricted pursuit permit were allowed to pursue in one of those units. A list of bear units, season dates, rules and regulations for the 2012 black bear hunting and pursuit seasons can be found in the 2012 Utah Black Bear Guidebook.

METHODS

All successful hunters were required to have their bear checked by a Division office or officer within 48 hours of harvest. At that time, tooth samples were collected, and a permanent tag affixed. Bear harvest information was also collected. Teeth were sectioned and cementum annuli counted by an independent lab, to estimate age of harvested bear. Bears aged to be 5-yrs or older were considered adults for the purposes of calculating percent adult males in the harvest. Bear pursuit information was obtained using a random telephone survey of a statistically valid sample of bear pursuit permit holders. Data were not collected for the fall pursuit season.

Harvest data from depredating bears, or bears involved in human safety incidents, were taken from damage reports received from USDA-APHIS Wildlife Services and from bears taken by Division personnel. Livestock operators could kill damaging bears and were required to have the carcass checked by a Division officer within 48 hours. Harvest information was collected at that time. Other mortality includes roadkill, poaching, found dead, etc.

Changes from Previous Reports

Age information for bears harvested during the 2011 fall season were not available for last year's report, and have been included in this report. Mean age and survival data that were reported in the 2006-2010 annual reports were calculated using a fall-spring year (i.e., overlapping seasons) instead of a calendar year. Beginning with last year's annual report, we returned to using the full calendar year for calculation of age data and survival, and mean ages and survival for 2006-2010 were recalculated using calendar year.

This annual report presents the most complete and accurate summary of black bear harvest data available at the time of publication. Occasionally, we will adjust previous years' harvest

numbers in a subsequent report as more data were made available after publication. This is typically the case with counts of Wildlife Services (depredation) mortality, and only rarely will counts of hunter harvest need adjustment.

RESULTS

In 2012, 538 limited-entry black bear permits and 161 harvest-objective permits were sold. Hunters harvested 234 bears, 161 of which were taken in the spring and 73 in the fall. 42% of permits were filled. None of the harvest-objective seasons closed early, although the spring Wasatch Mtns, Avintaquin/Currant Creek unit met its quota during the final weekend of the season. The percent of females in the harvest increased from 24% in 2011 to 36% in 2012. 54 bears were killed as a result of depredation or other mortality.

Utah issued 456 black bear pursuit permits in 2012. Of these, 103 permits were sold through a drawing system and were valid for one restricted summer pursuit unit/season, in addition to all other unrestricted units and seasons. A total of 285 pursuers went afield during the spring pursuit season, while 140 pursuers pursued in unrestricted units during the summer pursuit season, and 54 pursuers pursued in restricted units during the restricted summer pursuit seasons. During the spring pursuit season, pursuers treed 0.4 bears per day, while during the summer pursuit season, pursuers treed 0.3 bears per day.

More detailed information describing the 2012 black bear harvest and black bear harvest trends can be found in the following tables and figures.

Statewide black bear historical harvest statistics, Utah 1967–2000.
