UTAH FURBEARER MANAGEMENT UNITS

DEFINITIONS

Incidental harvest: Furbearers harvested in traps that were intended for a different furbearer species.

Trap year: Year during which a particular trapping season ended. For example, for simplification in figures, trap year 2011 corresponds to the 2010–2011 furbearer season as outlined in the 2010–2011 Furbearer Guidebook.

Total trappers: Number of furbearer license holders who trapped furbearers during a particular trap year. License holders who took furbearers by means other than trapping, including shooting or with the aid of dogs, are included in this figure except for bobcat, coyote, and raccoon.

Total harvest: Number of furbearers of a particular species taken by means of trapping and hunting by furbearer license holders. This figure does not include harvest of unprotected wildlife, such as coyote, muskrat, red fox, raccoon, or striped skunk, by persons who did not purchase a furbearer license, nor does it include harvest of furbearers taken for creating a nuisance or causing damage.

Total set-days: Number of traps set during the furbearer season for the trapping of a particular species, multiplied by the number of days these traps were in the field. This figure pertains only to trapping, and does not include days afield by furbearer hunters or pursuers.

Pelt price: Average price paid for pelts of a specific furbearer species harvested in Utah, obtained mainly from a summary of the prices bid at the Utah Trappers Association fur auction, as well as prices from a survey of registered furdealers buying pelts harvested in Utah.

Wildlife Services harvest (coyote only): Number of coyotes killed by USDA-APHIS Wildlife Services in a particular year. Prior to 2006-2007, Wildlife Services yearly harvest summaries applied to their fiscal year, which begins October 1 and ends September 30, although most harvest takes place during spring. Beginning in 2006-2007, Wildlife Services harvest is reported for the period July 1 to June 30 of the following year.

INTRODUCTION

The furbearer harvest report presents furbearer harvest and trapper/hunter effort trends across the state of Utah, based on data collected from furbearer trappers and hunters. This report represents the furbearer portion of the Annual Performance Report for Federal Aid Project W-65-M, segment 59, grant agreement period October 1, 2010 through September 30, 2011. This Federal Aid project covers the 2010–2011 trapping seasons. Additionally, this report presents statewide trends since the early 1980s and population trend indicators for bobcats as well as the estimated economic value of Utah's furbearer harvest each year. Furbearer harvest and trapper/hunter effort may be more driven by pelt price than by availability, so annual fur harvest should not be used as the sole means to assess/project population sizes.

Bag Limits and Season Dates

Furbearers include badger, beaver, bobcat, gray fox, kit fox, mink, marten, ringtail, spotted skunk, and weasel, and a furbearer license is required to harvest any of these species, during the specified harvest season. An additional permit is required to harvest bobcat or marten. Coyote, muskrat, red fox, raccoon, and striped skunk are not under the jurisdiction of the Division, and/or are unprotected. Those species may be taken year-round without a license; therefore, results presented in this report do not include harvest by persons who did not purchase a furbearer license. It is prohibited to take black-footed ferret, fisher, lynx, otter, wolf, and wolverine. There are no bag limits for furbearers, except bobcats.

Furbearer season dates and bobcat possession limit, Utah 2010–2011 seasons.

Season	Bobcat possession limit	Season dates			
		Coyote, Red Fox, Muskrat, Raccoon, Striped Skunk	Badger, Kit Fox, Gray Fox, Ringtail, Spotted Skunk, Weasel, Marten	Beaver and Mink	Bobcat
2010-2011	3	Year-round	10/02/10–2/06/11	10/02/10–4/10/11	12/01/10–2/06/11

METHODS

Furbearer Harvest Survey

In 2006, the Utah Division of Wildlife Resources switched from a mail questionnaire to a telephone survey. Telephone surveys are thought to be better than mail questionnaire because they achieve a more random sample, thus, reducing the response bias caused by trappers who did not harvest animals not returning their questionnaires. Telephone surveys also allow you contact a smaller number of license holders to achieve the same level of accuracy. The accuracy of that phone survey is dependent upon the following assumptions: (1) a random sample was achieved (i.e. there was no response bias by those who harvested successfully versus those who did not), (2) respondents recorded or remembered data accurately and did not guess or lie, and (3) respondents clearly understood the questions.

For bobcats, we determined the total number of bobcat trappers/hunters who were surveyed, and this number was projected by the total number of furbearer trappers/hunters who purchased one or more bobcat permits. For bobcats and martens, it was required by proclamation that the pelts of animals harvested in Utah be brought to a Division office or officer to have a permanent tag attached and to surrender the lower jaw. Bobcat and marten harvest data presented in this report, such as county of kill and sex of harvest, were collected at this time; as such, this information is not projected. Additional information on bobcat harvest, such as harvest effort by method, number of sets, and number of days was determined by telephone survey. Due to the small number of marten trappers in Utah, we did not attempt to survey marten trappers. Instead, since a separate permit is required to trap marten, we assumed that all those who purchased a marten permit attempted to trap marten.

In an effort to obtain information on how many furbearers of a given species were taken incidentally, furbearer trappers were asked the question “Did you harvest any (species) in traps that were set for a different species, and, if so, how many?” Prior to 2010, all incidental take was included in the total harvest and harvest effort statistics. Beginning in 2010, the harvest survey was adjusted so that incidental take could be separated from the rest of the furbearer harvest and effort statistics. Therefore, 2010 harvest and effort statistics do not include incidental take (unless specified otherwise).

Data Analysis

When dealing with survey data, it is not uncommon to have outliers (i.e., data that do not fall within realistic values). A repeated problem in the furbearer survey was having a trapper report a high harvest with little trap effort (i.e. 10 furbearers harvest with 1 trap set for 1 day). For this situation we assumed that the total harvest was reported correctly, but the trapping effort was either reported or recorded erroneously. By doing so, these data records were included in the total statewide harvest of a furbearer species, but the total statewide number of traps set, trapping days and set-days could not be determined. To obtain estimates of furbearers/trapper, set-days/furbearer, and furbearers/1000 set-days, we used the remaining data points, excluding outliers.

Because some furbearer species in Utah are rare or not highly sought after by trappers, it is not possible to achieve sufficient sample sizes for these species to make valid statistical inferences. Although the trends for statewide harvest and effort are still valid, at the county level, the harvest and effort estimates have low precision and are likely inaccurate. As such, results by county are only reported for species with a sample size ≥ 20 .

Bobcat Age Determination and Other Data Methods

To determine age structure of the bobcat harvest, a canine tooth from each bobcat jaw was sectioned, and aged using cementum annuli by Matson’s Lab in Milltown, Montana. Survival rates were estimated using the Chapman-Robson estimator. Pelt prices were obtained mainly from a summary of the prices bid at the Utah Trappers Association fur auction, as well as from a survey of registered furdealers buying pelts harvested in Utah.

RESULTS

License Sales and General Survey Results

Beginning December 1, 2005, furbearer licenses were valid for 365 days from the date of purchase. Because of this change, we used the 365-day period of May 1 to April 30 to determine the total number of furbearer licenses sold for the furbearer season. A total of 1,817 furbearer licenses were sold for the 2010-2011 season. The percentage of license holders who bought a furbearer license but did not attempt to harvest furbearers was 30%. The number of trappers afield in 2010-2011 was 1,270, which was slightly down from to the 10-yr average of 1,325.

Furbearer Harvest Statistics

Total estimated furbearer harvest for 2010–2011 was 31,731, which was slightly higher than the 10-yr average of 29,142, and higher than the previous 5 years. Most of the increase in harvest in 2011 was due to increased take of non-protected species—muskrat, raccoon, red fox, striped skunk—a trend observed over the last several years. Harvest of coyote, marten, mink, muskrat, raccoon, spotted skunk, and striped skunk were all above the 10-yr average, while badger, beaver, bobcat, gray fox, kit fox, red fox, ringtail, and weasel harvest were below.

Pelt Price and Economic Value

The estimated economic value of Utah's furbearer harvest in 2011 was \$794,368. Average pelt price was up for most furbearer species compared with 2010, specifically beaver, bobcat, coyote, gray fox, red fox, kit fox, mink, muskrat, raccoon, and ringtail.

Summary of furbearer license sales and survey responses, Utah 1983–2011.

Trap year	Furbearer licenses sold			License holders sampled		Projection factor	% license holders not afield

*Economic value was determined by multiplying average pelt price by total harvest for a given species.

Species with missing values contributed to Utah's annual furbearer harvest but were not included in the economic value estimate due to missing average pelt price or harvest data. No data was available for 2006–2007. From 2001 to 2005, average striped skunk pelt price was used to calculate all skunk (spotted and striped) economic value.

Economic value* (in dollars) of furbearer species in Utah's annual furbearer harvest, Utah 1983–2011 (cont.).

Prey index

Lagomorph densities are generally considered to be a good indicator of bobcat recruitment and survival because high lagomorph populations provide an essential prey base for dispersing bobcats. When lagomorph populations are high or increasing, the bobcat population has also increased or at least remained stable. Thus, low populations of lagomorphs will reduce the likelihood of younger bobcats surviving to the next year. Cottontail rabbit and snowshoe hare data are taken from the Utah Upland Game Annual Report 2010 (2010-11 seasons).

Relationships in harvest statistics between bobcat and prey, Utah 1983–2011.

Population trends

Bobcat harvest age and sex ratios, Utah 1986–2011.

In annual reports prior to 2005–2006, the "juvenile" age category referred only to kittens (age 0.5) while "adults" included all bobcats age 1.5 and older. Beginning with the 2005–2006 annual report, the term "juvenile" now refers to kittens and yearlings (ages 0.5–1.5), while "adult" includes all bobcats age 2.5 and older.

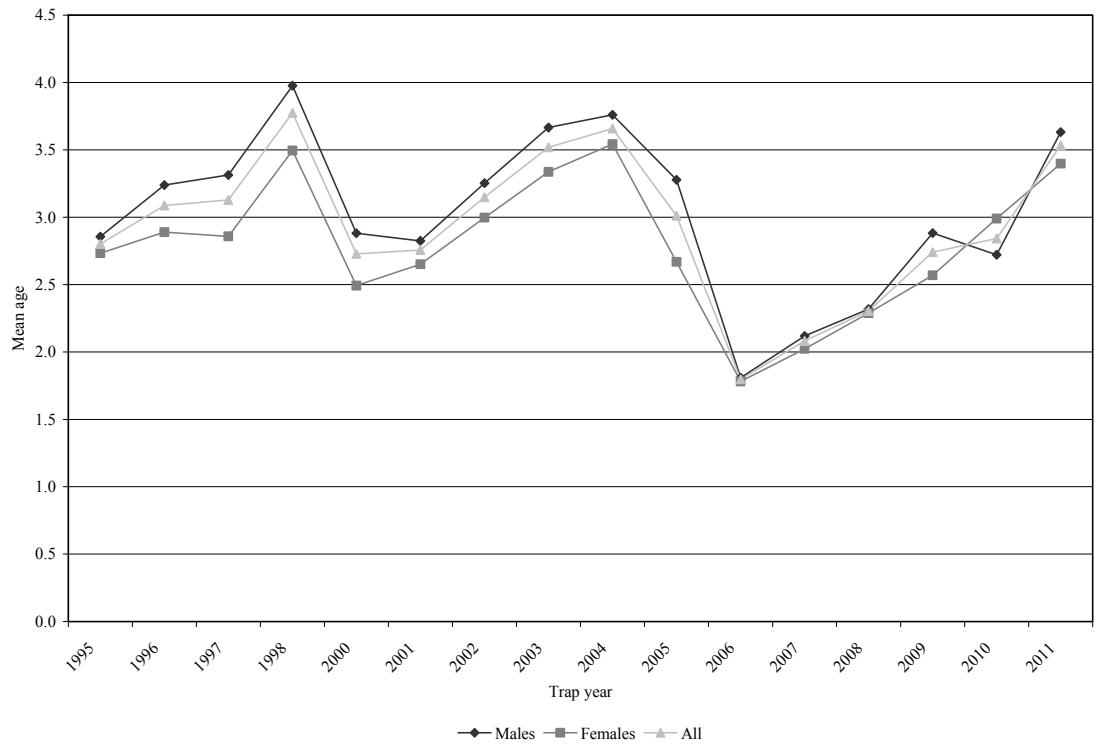

Adult and juvenile bobcat survival (from Chapman-Robson estimator), Utah 1986–2011.
