Appendix: Utah furbearer management ecoregions	61

DEFINITIONS

Incidental harvest: Furbearers harvested in traps that were intended for a different furbearer species.

Trap year: Time frame corresponding to the 2016–17 furbearer seasons, as outlined in the 2016–17 Utah Furbearer Guidebook.

Trappers afield: Number of furbearer license holders who trapped furbearers during a particular trap year. License holders who took furbearers by means other than trapping, including shooting or with the aid of dogs, are included in this figure except for bobcat.

Total harvest: Number of furbearers of a particular species taken by means of trapping and hunting by furbearer license holders. This figure does not include harvest of unprotected wildlife, such as coyote, muskrat, red fox, raccoon, or striped skunk, taken by persons who did not purchase a furbearer license, nor does it include harvest of furbearers taken for creating a nuisance or causing damage.

Total set-days: Number of traps set during the furbearer season for the trapping of a particular species, multiplied by the number of days these traps were in the field. This figure pertains only to trapping, and does not include days afield by furbearer hunters or pursuers.

Pelt price: Average price paid for pelts of a specific furbearer species harvested in Utah, obtained mainly from a summary of the prices bid at the Utah Trappers Association fur auction, as well as prices from a survey of registered furdealers buying pelts harvested in Utah.

Wildlife Services harvest (coyote only): Number of coyotes taken by USDA-APHIS Wildlife Services in a particular year. Prior to 2006–07, Wildlife Services yearly harvest summaries applied to their fiscal year, which begins October 1 and ends September 30, although most harvest takes place during spring. Beginning in 2006–07, Wildlife Services harvest is reported for the period July 1 to June 30 of the following year.

INTRODUCTION

The furbearer harvest report presents furbearer harvest and trapper/hunter effort trends across the state of Utah, based on data collected from furbearer trappers and hunters. This report represents the furbearer portion of the Annual Performance Report for Federal Aid Project W-65-M, segment 65, grant agreement period July 1, 2016 through June 30, 2017. This Federal Aid project covers the 2016–17 trapping seasons. Additionally this report presents statewide trends since the early 1980s and population trend indicators for bobcats as well as the estimated economic value of Utah’s furbearer harvest each year. Furbearer harvest and trapper/hunter effort may have been more driven by pelt price than by availability, so annual fur harvest should not be used as the sole means to assess/project population sizes.

Furbearers included badger, beaver, bobcat, gray fox, kit fox, mink, marten, ringtail, spotted skunk, and weasel. A furbearer license was required to harvest any of these species, and additional permits were required to harvest bobcats and martens. There were no bag limits for furbearers, except bobcats. Each bobcat permit allowed a person to harvest one bobcat, and a single person could obtain up to 6 bobcat permits in 2016–17. Sales of bobcat permits were not capped. Season dates for badger, gray fox, kit fox, marten, ringtail, spotted skunk, and weasel were September 24, 2016 through March 1, 2017. Bobcat season was November 16, 2016 through March 1, 2017. Season dates for beaver and mink were September 24, 2016 through April 5, 2017.

Coyote, muskrat, red fox, raccoon, and striped skunk were not under the jurisdiction of the Division, and/or were unprotected. Those species could be taken year round without a license; therefore, results presented in this report do not include harvest by persons who did not purchase a furbearer license. It was prohibited to take black-footed ferret, fisher, lynx, river otter, wolf, and wolverine.

METHODS

Furbearer harvest and effort information was obtained from a telephone/web mixed-mode survey of a statistically-valid random sample of furbearer license holders. The accuracy of that survey was dependent upon the following assumptions: (1) a random sample was achieved (i.e., there was no response bias by those who harvested successfully versus those who did not), (2) respondents recorded or remembered data accurately and did not guess or lie, and (3) respondents clearly understood the questions.

Trappers who harvested bobcats and martens were required to bring the animals’ pelts to a Division office or officer to have permanent tags attached and to surrender the lower jaws. Bobcat and marten harvest data presented in this report, such as county of kill and sex of harvest, were collected at that time; as such, that information was not projected. Additional information on bobcat harvest, such as harvest effort by method, trappers-afield, number of sets, and number of days was determined by the survey mentioned in the preceding paragraph. Due to the small number of marten trappers in Utah, we did not attempt to survey marten trappers. Instead, since a separate permit is required to trap marten, we assumed that all those who purchased a marten permit attempted to trap marten.

To determine age structure of the bobcat harvest, a canine tooth from each bobcat jaw was sectioned, and aged using cementum annuli by Matson's Lab in Manhattan, Montana. Survival rates were estimated using the Chapman-Robson estimator. Pelt prices were obtained mainly from a summary of the prices bid at the Utah Trappers Association fur auction, as well as from a survey of registered furdealers buying pelts harvested in Utah.

Because some furbearer species in Utah were rare or not highly sought after by trappers, it was not possible to achieve sufficient sample sizes for these species to make valid statistical inferences. Although the trends for statewide harvest and effort were still valid, at the county level, the harvest and effort estimates had low precision and were likely inaccurate. As such, results by county were only reported for species with a sample size ≥ 20 .

Corrections and Clarifications

In an effort to obtain information on how many furbearers of a given species were taken incidentally, furbearer trappers were asked the question “Did you harvest any [species] in traps that were set for a different species, and, if so, how many?” Prior to 2009–10, all incidental harvest was included in the total harvest and harvest effort statistics. In the 2009–10 and 2010–11 annual reports, incidental harvest was included in statewide summaries of total furbearer harvest, but not in species-specific tables. This omission in 2009–10 and 2010–11 caused some confusion because harvest totals did not match between tables. Furthermore, comparisons of species-specific trapping harvest with prior years’ numbers were confounded. This annual report was modified, beginning with the 2011–12 report, to include incidental harvest in species-specific statewide historical harvest tables, as well as split out hunt harvest from trapping harvest.

RESULTS

License Sales and General Survey Results

Furbearer licenses were valid for 365 days from the date of purchase. We used the 365-day period of April 1 to March 31 to determine the total number of furbearer licenses sold for the furbearer season. A total of 2,132 furbearer licenses were sold for the 2016–17 season. The percentage of license holders who bought a furbearer license but did not attempt to harvest furbearers was 31%. The number of trappers afield in 2016–17 was 1,468.

Furbearer Harvest, Historical Trends, and Economic Value

The majority of the harvest taken by furbearer license holders in 2016–17 was of non-protected species—coyote, muskrat, and raccoon—and the total harvest of these species has fluctuated considerably over the last ten years. Total harvest of regulated furbearer species (i.e., species with designated trapping seasons) was 4,793 in 2016–17, lower than the 10-yr average of 5,677. The estimated economic value of Utah’s furbearer harvest in 2016–17 was \$794,363.

*Economic value was determined by multiplying average pelt price by total harvest for a given species.

Species with missing values contributed to Utah's annual furbearer harvest but were not included in the economic value estimate due to missing average pelt price or harvest data. No data was available for 2006–07. From 2001 to 2005, average striped skunk pelt price was used to calculate all skunk (spotted and striped) economic value.

Economic value* (in dollars) of furbearer species in Utah's annual furbearer harvest, Utah 1982–2017 (continued).

*Statewide totals for sample size and hunters afield are not totals of the columns because hunters hunted multiple counties.

**Total harvest numbers are from pelt check-in, while numbers of hunters afield and effort are determined from harvest survey.

Prey index

Lagomorph densities are generally considered to be a good indicator of bobcat recruitment and survival because high lagomorph populations provide an essential prey base for dispersing bobcats. When lagomorph populations are high or increasing, the bobcat population has also increased or at least remained stable. Thus, low populations of lagomorphs will reduce the likelihood of younger bobcats surviving to the next year. Cottontail rabbit and snowshoe hare data are taken from the Utah Upland Game Annual Report 2016–17 (2016–17 seasons).

Relationships in harvest statistics between bobcat and prey, Utah 1982–2017.

Population trends

Bobcat harvest age and sex ratios, Utah 1985–2017.

Average	1.3	0.6	1.0	0.9	1.1	0.45	0.44	1.3

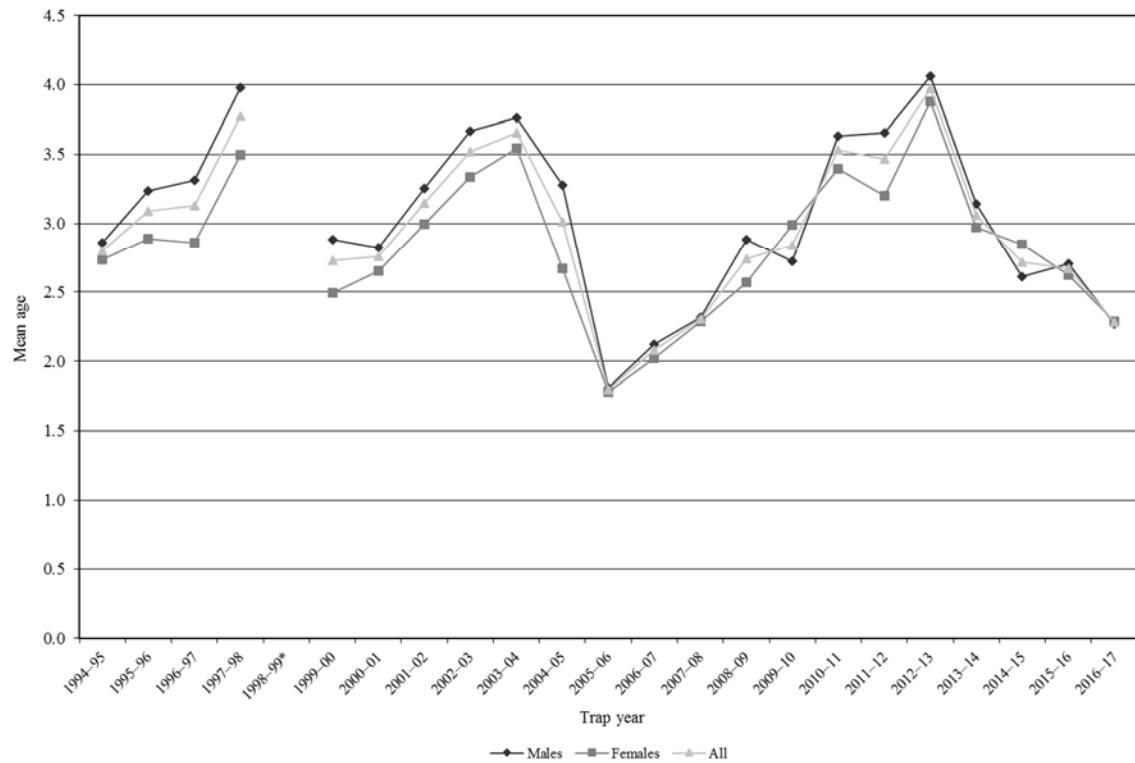

In annual reports prior to 2005–06, the "juvenile" age category referred only to kittens (age 0.5) while "adults" included all bobcats age 1.5 and older. Beginning with the 2005–06 annual report, the term "juvenile" now refers to kittens and yearlings (ages 0.5–1.5), while "adult" includes all bobcats age 2.5 and older.

Adult bobcat survival (from Chapman-Robson estimator), Utah 1985–2017.

Average	189	147	20592	4	14	124.2	94.2	2.85

Prior to the 2005–06 season, harvest by hunting and trapping were not collected separately and trapping harvest estimates included harvest by both hunters and trappers. Trap harvest includes incidental harvest.

*Trappers and muskrat per trapper include hunters and their harvest. Set-days per muskrat and muskrat per 1000 set-days are based only on trapping activity, and do not include hunt harvest or hunter-days afield.

Statewide muskrat harvest trends, Utah 1982–2017.

Muskrat harvest statistics by county and ecoregion, Utah 2016–17.

Prior to the 2005–06 season, harvest by hunting and trapping were not collected separately and trapping harvest estimates included harvest by both hunters and trappers. Trap harvest includes incidental harvest.

*Trappers and weasels per trapper include hunters and their harvest. Set-days per weasel and weasels per 1000 set-days are based only on trapping activity, and do not include hunt harvest or hunter-days afield.

Statewide weasel harvest trends, Utah 1982–2017.
